CULTURAL DIRECTIONS

Take a clean 5- or 6-in. pot, or 6- to 7-in. pan, and fill it to within 2 in. of the top with coarse ashes; on top of this put about 1½ in. of fine soil and firm down; give good watering with boiling water, using a fine rose; after drying off a little, sow the spores but do not cover, put in a saucer filled with water, placing a pane of glass over the pot or pan. Never top-water. After first real leaves appear they should be pricked out into flats.

NASTURTIIUMS (Tropæolum)

When grown in large masses in the border they produce a brilliant effect. They commence to bloom in the late Spring and continue profusely the whole season. All the varieties should be grown upon poor soil; this enables the flower to show above the foliage, while on rich soil, even though they flower abundantly, the flowers are hidden by the taller foliage. Water freely during the hot season.

PANSIES, Boddington's Giants

Our Giant Pansy Seed during the past season gave unprecedented satisfaction. All the testimonials received mentioned specially the high grade of flowers—color, form and size of the blossoms. This year, by adding improved types, intending customers can absolutely rely on a duplication of last season's success.

Sow seed in April or Fall, in well-moistened soil, improved by Thompson's Manure, cow-manure, or bone meal, in flats. When the seedlings are large enough to handle, transplant to permanent position, which must be light, well sheltered, and away from trees or branches. If exhibition blooms are wanted, allow only one bloom to grow on each shoot; water freely. Can also be sown in July and August for the following Spring; protection from frost is necessary.

PRIMULA SINENSIS

The flowers are remarkable, not only for size, beauty and brilliancy of the colors, but for the great substance of the petals. Considerable care is necessary in order to secure the successful germination of the seed of the choice kinds of P. Sinensis. The most suitable periods for sowing are January to May for Autumn, and June to August for Spring blooming. Shallow pans, well drained, are the best, the soil consisting of sandy loam and leaf-mold, worked through a fine sieve; the pans when thus prepared should be well watered before the seed is sown. Only a slight covering of soil or sand is needed. What has most to be guarded against is drought; the soil should be kept in as equable degree of moisture as possible, never being on the dry side. We attribute more failures to this cause than to any other. Just at the time when the seed commences to germinate the least departure from this is fatal.

Roots and Retarded Bulbs from Cold Storage

Cultural Directions.—Cold Storage Lily bulbs should be potted immediately after they are received from cold storage, well watered and the pots "plunged" in the coolest place available, preferably in a cellar or the north side of a building. This to induce as much root action as possible before growing starts. After growth starts many aerial roots form along the lower part of the stem, immediately above the bulb. It is, therefore, well to plant the bulb low in the pot. Fill the pot with earth only three-quarters full. After the growth is 10 to 12 in. high, fill the pot with good compost to within 1 in. of the top. This will furnish nutriment to the aerial roots, which must chiefly sustain the plants.
